<https://github.com/MarkNaeem>

Edinburgh, UK

A computer vision and robotics research and development engineer with demonstrated hands-on experience in industry and academia. A passionate self-learner with an urge to support open-source and research communities. A recognised team player in startups and prominent open-source projects, excelling in dynamic, self-directed, and challenging environments.

EXPERIENCE

Machine Learning Research Engineer

February 2024 – Present

Leap AI

Edinburgh, UK

Leap AI is a robotics company focused on robotic manipulation tasks in the food sector. My tasks and achievements as a member of the ML research team include:

- Built ApolloPose, a general 3D foundation model for CAD-prompted 6DoF pose estimation from RGB-D images, and demonstrated it in bin-picking of fresh produce with variable shapes and heavy occlusions.
- Researching and building foundation models to solve 3D spatial representation for robot manipulation (Embodied AI).
- Building infrastructure for cloud and on-premise training pipelines, and productionising models for real-world deployment.
- Planning software architecture for perception modules and the integration with the rest of other systems.
- Staying up-to-date with spatial reasoning and multimodal models research to prototype potential improvements.

Robotics Software Engineer – Perception

January 2022 – January 2024

Kingdom Technologies Ltd

Glasgow, UK

Kingdom is an autonomous lawnmower manufacturer for large-scale fields. Working in a small team for a startup, I undertook a diverse range of end-to-end responsibilities:

- Operated LiDARs, stereo cameras, GNSS, and IMUs in dynamic, unstructured, human-shared environments.
- Optimised and deployed real-time, safety-critical models on resource-constrained hardware.
- Developed perception systems for 3D detection, point cloud segmentation, open-set obstacle detection, trajectory prediction, and traversability estimation.
- Implemented different visual odometry techniques for GNSS-denied environments with limited visual features.
- Maintained CI/CD pipelines to streamline software deployment across a network of over 50 active assets.
- Delivered across the SDLC—from requirement analysis to embedded drivers, interfaces, testing, and maintenance.
- Built MLOps pipelines for training, testing, deployment, and performance monitoring for various vision models.

Machine Learning Research Engineer

September 2020 – December 2021

Uniparticle

Cairo, Egypt

Uniparticle is a software house specialised in large-scale and government projects. I worked on various projects in different areas of machine learning such as machine vision, recommendation systems, and probabilistic modelling.

- Built IDeepify, a complete end-to-end deep learning KYC (Know Your Customer) pipeline.
- Published a novel HMM-based assessment analysis technique with Discovery Education, validated on a coding competition.
- Developed BKT-CAT, a Bayesian adaptive testing system.
- Built an adaptive learning engine combining recommendation systems, knowledge space theory, and adaptive testing.
- Introduced probabilistic student modelling and various simulation techniques to enhance adaptive quizzes.
- Improved an existing adaptive testing simulation algorithm, optimising it to run 20 times faster.

Teaching Assistant - Machine Vision

September 2020 – February 2021

Ain Shams University

Cairo, Egypt

- Tutored and prepared the material for the machine vision course.
- The course covered traditional computer vision techniques and modern machine learning-based approaches.

PUBLICATIONS

Bayesian Knowledge Tracing for Assessment Results Analysis

February 2022

IEEE

[Link to the paper](#)

Bayesian Knowledge Tracing, a Hidden Markov model, is utilised to analyse assessment results. The model was validated with data collected from a coding competition. This project was a collaboration between Discovery Education and Uniparticle.

Linear Time Invariant State Space System Identification Using Adam Optimization

February 2020

IEEE

[Link to the paper](#)

A new system identification method is proposed. A state space model is presented with a TensorFlow graph. Adam optimisation is used to optimise the learnable state and input matrices.

PROJECTS

VSLAM Playground

A full Visual SLAM pipeline using deep learning-based feature descriptors and matchers and deep stereo depth estimation.

Depth Yolact ROS

A real-time 3D object detection and pointcloud instance segmentation for RGBD images.

Swerve Steering Controller – ROS Controller Package

A real-time safe N-wheel non-holonomic omnidirectional vehicle controller.

IDeepify

Robust KYC pipeline consisting of face recognition and matching, text segmentation, data extraction, and OCR.

Move Base Sequence – ROS Package

A ROS action server to handle multiple goals and track execution with ROS navigation stack.

Deep Computer-Aided Sperm Analysis (CASA)

Faster R-CNN object detection and a modified DeepSORT tracking were used to detect and track human spermatozoa in phase-contrast, dark-field, and bright-field microscopy imaging.

D435i Visual-Inertial Odometry and SLAM

Part of the graduation project. D435i camera was used to obtain reliable visual-inertial odometry and SLAM.

AWARDS

- Al-Alfi Foundation Scholarship for outstanding undergraduate students
- Erasmus+ research grant at the University of Central Lancashire (UCLan)
- Graduation project grant organised by the University of Lincoln and Ain Shams University
- Best project of the year for design of mechatronic systems course
- 1st place in FSUK18 C&M, honoured by the Egyptian president in the National Youth Conference 2018, Egypt

SKILLS

C/C++, Python, Git, CI/CD, Linux, Docker, Kubernetes, MLFlow TensorFlow, PyTorch, AWS, GCP, Azure, Distributed Parallel Training, Reinforcement Learning, LLM Fine Tuning, ROS/ROS2, ADAS, State Estimation, Localisation, SLAM, Visual Odometry, Sensor Fusion, Multi-Sensor Calibration, Motion Planning, CUDA, RTOS, Embedded Software, Teamwork, Leadership, Self-Discipline, Problem-Solving

EDUCATION

Ain Shams University

September 2015– June 2020

B.Sc. in Mechatronics Engineering – Robotics - Class of 2020

Five-year degree

- **GPA:** 3.86/4.00
- Ranked Top 5 (3rd)
- **Graduation Project:** Autonomous mobile manipulator for fruit picking – A collaboration between Ain Shams University and University of Lincoln. (project GPA: 4.00/4.00 A+)
- **Activities:** ASU Racing Team FSUK'18, ASU-Sussex racing team FSUK'19, Erasmus+ Mobility Project
